

Storey — features reference

What's live · what's coming · who uses what

Last updated 2026-05-22 (after v1.1.6 + the day's dashboard rewrites)

What Storey is

Storey is a site-operations app for construction contractors in Northeast India — and for the specialist trades (electricians, plumbers, masons, painters) running their own field work. Built for the daily reality of construction: workers, materials, tasks, photos, sub-contractors, expenses. One app, mobile-first, offline-aware, multi-tenant with strict data isolation.

Modules — what's live in v1.1.6

Module	What it does	Live since
Sites	Create and manage construction sites. Status (active, planning, completed, on-hold), budget, dates, location.	v1.0
Workers	Labour roster — onboard workers, trade/skill, daily wage, ID proof masked to last 4 digits. Progressive disclosure: 5 essential fields visible, rest behind a toggle.	v1.0 (UX simplified v1.1.6)
Attendance	Daily presence marking by supervisor → confirmation by site manager. Append-only audit log.	v1.0 (confirmation layer v1.1.0)
Daily Logs	Site progress reports with photos, weather, workers-present, work-done, issues. Photos carry date-time stamps burned in.	v1.0 (photo capture v1.1.0)
Tasks	Work-assignment cascade from contractor → site_manager → supervisor → worker. Daily updates with photos, status transitions, sub-tasks. Sub-tasks blocked once parent is submitted or done.	v1.0 (sub-task fix v1.1.5)
Materials — Inventory	Per-site stock. Materials tracked with quantity, unit, category (consumable vs equipment), minimum reorder level. Supervisor can now allocate to work.	v1.0 (allocation atomic + validated v1.1.7)
Material Receipts (GRN)	Inward register — store keeper records receipt → site manager confirms.	v1.0
Material Transfers	4-stage transfer between sites: initiate → supervisor confirms dispatch → store keeper / site manager approves → receiving site accepts. Stock updates per stage.	v1.1.0
Material Ledger	Append-only transaction history per material — receipts, allocations, transfers, adjustments. Cannot be edited or deleted; corrections happen as offsetting entries.	v1.1.0
Equipment / Assets	Non-consumable equipment (drills, scaffolding, helmets, vehicles). Issue to worker / sub-contractor, return on completion, maintenance tracking. Supervisor can now issue + return.	v1.0 (supervisor access v1.1.7)
Expenses	Site-level spend tracking with receipts + approval flow.	v1.0
Reports	Per-site summaries — attendance, materials, expenses, payroll, budget vs actual.	v1.0
Team	Roster of users in your tenant — name, role, email, phone.	v1.0
Invites	Send signup invites via email; expiry, pending status visible.	v1.0
Offline mode	Mark attendance, file daily logs, add expenses without internet. IndexedDB queue, auto-sync when online.	v1.1.0
Photo capture	On-site photos with timestamp burned into the corner. Camera-first (no gallery picker by default).	v1.1.0

What's coming in v1.2 (the 4-week window)

Driven by feedback from real contractors (Arun, 2026-05-20). Built when both the 12-tester gate and pilot confirmation clear.

Feature	What it does
Material budget vs actual	Site-level material budgets set during setup. Real-time deviation tracking as receipts and consumption flow.
Sub-contractor onboarding	Onboard sub-contractors as entities (Path A — they don't log in; site_manager / contractor manages their record). 17-trade taxonomy. Agreed amount, scope, dates.
Sub-contractor payment ledger	Track every payment to a sub-contractor against the agreed amount. Running balance. Payment passbook view.
Variation Orders	Scope additions to existing sub-contractor agreements without rewriting the original. Variations stack on the Work Order PDF.
Printable Work Order PDF	One-click signed Work Order per sub-contractor — contractor letterhead, scope, agreed amount in figures + words, advance/balance, signature blocks, QR code linking back to the digital record.
Task / sub-contractor aware allocation	Material allocation can attribute consumption to a specific task or sub-contractor. Three modes: general site work, to a task, to a sub-contractor.
Flag-and-correct workflow	Supervisor flags his own allocation mistakes; site_manager / contractor reviews and approves the correction. Original entry preserved in the append-only ledger.
"Your data, your Drive"	Daily automatic backup of your tenant's data to your own Google Drive. Tally-style data ownership — your data lives where you can touch it.

Roles & permissions

Role	Who they are	What they do
Contractor	Owner-operator, business head	Sets up the company, sites, budgets. Approves expenses + transfers + sub-contractor agreements. Sees everything in their tenant.
Site Manager	Engineer or PM overseeing one or more sites	Confirms attendance, daily logs, tasks. Approves transfers + expenses. Operates as primary day-to-day reviewer.
Supervisor	On-site role — runs the day	Marks attendance, files daily logs, creates tasks for workers, allocates material to work, issues equipment, dispatches transfers.
Store Keeper	Materials warehouse / store	Records material receipts, manages stock, initiates transfers.
Super Admin	Platform-level (Storey team only)	Tenant management, platform stats. Not a customer-facing role.

All cross-role data access is enforced via Postgres RLS + role-helper functions. No application-layer guards are the only line of defence.

Login & sign-up options

Option	State	Notes
Email + password	 Live	Primary recommended path for all roles. Email goes to <code>noreply@storeyinfra.com</code> via Resend SMTP.
Google sign-in (OAuth)	 Live	One-tap; OAuth consent screen currently in Testing mode (verification pending — labelled "STOREY" + logo).
Magic link	 Live	Email-based passwordless login. Useful for users without strong password recall.
Invite flow	 Live	Site Managers / Supervisors / Store Keepers invited by contractor via email link.
Phone OTP (SMS)	 Preview	Currently functional but not the recommended primary path. Workable for users without email, but reliability + delivery in NE India can vary. We'll mature this in v1.x.

***Recommended pitch posture:** lead with Google sign-in or email signup for new contractors. Use SMS OTP only when a tester specifically can't use the other paths.*

Brand & UX principles applied throughout

- **Visual-first** — picture beats text, status = colour + icon (never text alone), big numbers carry meaning, empty states illustrate the next action
- **Three visual tiers** — Lucide-style icons (small), inline-SVG line illustrations (medium), real photos (only for evidence)
- **English-default UI** — Hindi / Assamese will be an opt-in Settings toggle in a future release; defaulting to Hindi would read as condescension to most NE-India contractor buyers
- **Mobile-first** — every page works on a phone first; desktop is a wider composition of the same components
- **Offline-first writes** — every form queues locally and syncs when online; no data loss on flaky 4G
- **Append-only ledgers** — materials, tasks, attendance, daily logs all preserve history. Corrections happen via offsetting entries, never destructive edits.

What's deliberately NOT yet in Storey

Honest about gaps so prospects know what to expect.

Gap	When it'll appear
Quality assurance (slump test, cube test, level surveys)	v2 candidate
Compliance / statutory (PWD inspections, electrical sign-off)	v2 candidate
Logistics / transport (vehicles, fuel, drivers)	v2 candidate
Drawings / RFI management	v2 / v3
Client communication thread	v2 wedge
Hindi / Assamese UI toggle	v1.x when a paying customer asks
Project timeline / Gantt	v1.x backlog
In-app notifications centre	v1.x backlog
AI voice input for daily logs (Hindi/Assamese)	v1.x experiment after v1.2

Storey today covers about **70 % of daily ops well** — the daily-bread workflow that supervisors and site managers run every day. The remaining 30 % is mostly *episodic* (compliance) or *enterprise-grade* (RFI, drawings) — not what the NE-India SMB beachhead needs at v1.
